

used to

monitor the

abondoned

areas

fire warning

systems are

used

can

significantly

shorten the

reaction time

detection

method using

image

processing

algorithms

are used

destroyed and

produces high

amount of

carbon-di-oxide

acts as lens which

focuses the

sunlight and it

starts the

ignition

abondened

areas cannot

be monitored

each other in high

wind velocities

that causes

friction and fire

people are

affected by

forest fire
